Pandemic mainly comes through nature but at times it also spreads through the selfish motives of some rich politicians with the assistance of unethically behaved scientists.

Covid19 is one which has the origin from human negligence rather than natural phenomenon. Had it been a natural phenomenon then the world would have been annihilated to one third of its population roughly. This peculiar Corona virus is different from all the ones humanity has faced in which it is very difficult to eradicate in a short interval of time.

It is a satisfying note that every government formulated the Do's and Don'ts for different categories of the population. It is also appreciated that they came out with scientifically proven guidelines for all kinds of diseased population. It was so absorbing to see that almost all the governments took their own initiatives without waiting for the other to assist. WHO played the best role in this crisis.

Now coming to the ethical concerns I wish to ask the researchers involved in the virus if they were adhering to JUSTICE when treating the different types of patients affected by corona virus. This aspect of research seems to be missing. If we are to be highly ethical our research should include the data of the virus affected people linked with their ailments (diabetes, HIV/AIDS/Hypertension, etc). We should think of a separate team of researchers to look into the conditions of Diabetic population that were affected by the corona virus as this will be an eye-opener for other kind of diseases.

Hence it is high time that my opinion which may be an old one must be implemented with true spirit so that human kind may be prepared for the worst pandemic that will harm the different people with different types of diseases. It is also good if the researchers can come out with data of age wise affected people so that we can make some logical conclusions which may be useful for the future generations.
