**Procedure**

Patient is placed in the operating room under spinal anesthesia and in gynecological position. We performed FemiLift procedure and External Rejuvenation using CO₂ Laser and dedicated handpieces. For the hypertrophy of both labia minora, we used the vaporization effect on mucocutaneous folds setting the laser. Once the anatomical correction is achieved, we proceed to complete with a suture using polyglactin 910 absorbable. Finally, we trimmed the hypertrophic caruncula using focused laser.

Surgery total surgical time was 80 minutes with no complications.

Post-operative indications: We recommend use of ice locally and hygiene with neutral pH soap. Patient should abstain from sex for six weeks due to external sutures. Control is done at 7 and 40 days.
